**Abstract:** Perhaps one of the best-known machine learning models is that of artificial neural networks, where a number of parameters must be adjusted to learn a wide range of practical problems from areas such as Physics, Chemistry, Medicine, etc. Such problems can be reduced to pattern recognition problems and then modeled from artificial neural networks, whether these problems are classification problems or regression problems. To achieve the goal of neural networks, they must be trained by appropriately adjusting their parameters using some global optimization methods. In this work, the application of a recent global minimization technique is suggested for the adjustment of neural network parameters. In this technique, an approximation of the objective function to be minimized is created using artificial neural networks and then sampling is done from the approximation function and not the original one. Therefore, in the present work, learning of the parameters of artificial neural networks is done using other neural networks. The new training method was tested on a series of well-known problems and a comparative study was made against other neural network parameter tuning techniques and the results were more than promising. From what was seen after running the experiments and comparing the proposed technique with others that have been used for classification datasets as well as regression datasets, there was a significant difference in the performance of the proposed technique, starting with 30% for classification datasets and reaching 50% for regression problems. However, the proposed technique, since it presupposes the use of global optimization techniques involving artificial neural networks, may require significantly higher execution time than other techniques.

## 1. Introduction

Artificial Neural Networks (ANNs) are parametric models [1–3] that appeared in machine learning and they are widely used in pattern recognition problems. A series of practical problems from the fields of physics [4–6], chemistry [7–9], economics [10–12], medicine [13,14] etc. can be transformed to pattern recognition problems and then solved using Artificial Neural Networks. Also, neural networks have been used with success to solve differential equations [15–17], solar radiation prediction [18,19], Spam detection [20–22] etc. Moreover, variations of artificial neural networks have been employed to solve agricultural problems [23,24], facial expression recognition [25], prediction of the speed of wind [26], the gas consumption problem [27], intrusion detection [28], hydrological systems [29] etc. Also, Swales and Yoon discuss the application of artificial neural networks to investment analysis in their work [30].

A neural network can be denoted as a function  $N(\vec{x}, \vec{w})$  where the vector  $\vec{x}$  stands for the input vector and the vector  $\vec{w}$  is the set of the parameters of the neural network that should be estimated. The input vector is usually called pattern in the relevant literature

and the vector  $\vec{w}$  is usually called the weight vector. Artificial neural network training methods adjust the vector of weights in order to minimize the following quantity:

$$E(N(\vec{x}, \vec{w})) = \sum_{i=1}^M (N(\vec{x}_i, \vec{w}) - y_i)^2 \quad (1)$$

In the previous equation, that will be called training error, the set  $(\vec{x}_i, y_i)$ ,  $i = 1, \dots, M$  is the input train dataset for the neural network with  $M$  patterns. The value  $y_i$  is the expected output for the pattern  $\vec{x}_i$ . The Equation 1 can be minimized with respect to the weight vector using any local or global optimization method like the Back Propagation method [31,32], the Hill Climbing method [33], the RPROP method [34–36], Quasi Newton methods [38,39], Simulated Annealing [40,41], Genetic Algorithms [42,43], Particle Swarm Optimization [44,45], Differential Optimization methods [46,47], Evolutionary Computation [48], the Whale optimization algorithm [49] etc. Furthermore, Cui et al suggested the usage of a new stochastic optimization algorithm that simulates the plant growing process for neural network training. Also recently, the Bird Mating Optimizer [51] was suggested as a training method for artificial neural networks [50]. Also, hybrid methods have been developed by various researchers to optimize the weight vector, such as the work of Yaghini et al [53] that combined particle swarm optimization with a back propagation algorithm to minimize the error function. Moreover, Chen et al [52] has used a hybrid technique that combines particle swarm optimization and Cuckoo Search [54] to optimize the weight vector of neural networks.

In addition, many researchers have addressed the issue of initial values for the weights of neural networks, such as the incorporation of decision trees [55], an initialization method using the Cauchy's inequality [56], incorporation of discriminant learning [57], methods based on genetic algorithms [58,59] etc. A paper discussing all the aspects of weight initialization strategies can be found is proposed by Narkhede et al [60].

Moreover, various groups of researchers are dealing with the issue of constructing the structure of artificial neural networks, such as the incorporation of genetic algorithms [61], the usage of the Grammatical Evolution method [62] for the construction of neural networks [63], a constructing and pruning approach to optimize the structure of ANNs [64], usage of cellular automata [65] etc. Also, since the training of artificial neural networks by optimization methods requires significantly longer computing time, parallel techniques have been developed that take advantage of modern parallel computing units [66–68].

Another field of research in the field of artificial neural networks that attracts a multitude of researchers is that of dealing with the problem of overfitting that occurs in many cases. In this problem, although the artificial neural network has achieved a satisfactory level of training, this is not reflected in unknown patterns that were not present during training. This set of patterns will be called test set in the remaining of this work. Commonly used methods that tackle the overfitting problem are weight sharing [69,70], methods that reduce the number of parameters (weight pruning) [71–73], the method of dropout [74,75], weight decaying methods [76,77], the Sarprop method [78], positive correlation methods [79] etc.

In this paper, the use of a recent global minimization technique [80] called NeuralMinimizer, is proposed to find the optimal set for the weights of artificial neural networks. This innovative global minimization technique constructs an approximation of the objective function to be minimized using a limited number of its samples. These limited samples form the training set of an artificial neural network that can be trained with any optimization method. Subsequently, the sampling for the continuation of the global optimization method is not done by the objective function but by the already trained artificial neural network. The samples obtained by artificial neural networks before being fed into the global minimization method are classified and those with the smallest functional value will finally be input into the global minimization method. From the experimental results, it was shown that this global minimization method requires a limited number of samples

from the objective function to find the global minimum and is also more efficient than other techniques to discover the global minimum. Therefore, this paper proposes using artificial neural networks to train other artificial neural networks. This new procedure will be tested on a series of known problems, in order to evaluate its effectiveness.

The rest of this article is organized as follows: the section 2 described the proposed method, the section 3 list the experimental datasets and the results obtained by the incorporation of various methods and finally the section 4 discusses some conclusions.

## 2. The proposed method

In this section, some basic principles for artificial neural networks are presented and then a new training method that incorporates a modified version of the NeuralMinimizer global optimization technique is outlined.

### 2.1. Preliminaries

Let us consider that we have an artificial neural network with just one hidden layer, in which the sigmoid function is used as an activation function. The output value for every node in this layer is calculated as:

$$o_i(x) = \sigma(p_i x + \theta_i), \quad (2)$$

where the value  $p_i$  is the weight vector and  $\theta_i$  denotes the bias for the node  $i$ . The sigmoid function is defined as:

$$\sigma(x) = \frac{1}{1 + \exp(-x)} \quad (3)$$

and it is graphically illustrated in Figure 1.

**Figure 1.** The sigmoid function  $\sigma(x)$ .

When the neural network has  $H$  processing nodes, then output can be formulated as:

$$N(x) = \sum_{i=1}^H v_i o_i(x), \quad (4)$$

where  $v_i$  stands for the output weight for node  $i$ . Hence, by using one vector for all the parameters (weights and biases) the neural network can be written in the following form:

$$N(\vec{x}, \vec{w}) = \sum_{i=1}^H w_{(d+2)i-(d+1)} \sigma \left( \sum_{j=1}^d x_j w_{(d+2)i-(d+1)+j} + w_{(d+2)i} \right) \quad (5)$$

where  $d$  is the dimension of vector  $\vec{x}$ . From the Equation 5 we can conclude that number of elements in the weight vector have as:

$$d_w = (d + 2)H \quad (6)$$

## 2.2. The modified NeuralMinimizer method

In its original version, the method NeuralMinimizer employed RBF neural networks [81] to build a model of the objective function. Even though Radial Basis Function (RBF) networks have been used with success in a variety of problems [82–85], it is not possible to apply them to the training of the parameters of an artificial neural network due to the large dimension of the problem, as shown in Equation 6. Hence, in current work, the RBF network has been replaced by an artificial neural network that implements the Equation 5. The training of the artificial neural network was done using a local minimization technique that is not particularly demanding in calculations and storage space, such as Limited Memory BFGS (L-BFGS)[86]. Obviously, any other technique that is not extremely memory intensive could be used in its place. Such a technique could be the Adam method [139], the SGD method [87,88] or even a simple global minimization method such as a genetic algorithm with a limited number of chromosomes. The L-BFGS method is a variation of the Broyden–Fletcher–Goldfarb–Shanno (BFGS) method [89] using a limited amount of computer memory. This local minimization method has found wide application in difficult and memory-intensive optimization problems such as image reconstruction [90], inverse eigenvalue problems [91], seismic waveform tomography [92] etc. Because of the application of this technique to large-dimensional problems, a number of modifications have been proposed that make use of modern parallel computing systems [93–95]. A numerical study on the limited memory BFGS methods is provided in the work of Morales [96]. In the original publication of the NeuralMinimizer optimization method, an RBF neural network was used to generate the approximation function of the objective function. However, this would not always be possible in the case where the objective function to be minimized is the error of an artificial neural network, since an artificial neural network usually has a large number of parameters and this would require an extremely large storage space for training the global minimization method's RBF neural network.

In the following the main steps of the modified NeuralMinimizer method for the training of neural networks are listed. In this steps the neural network used by the NeuralMinimizer method will be called  $N_N(x, w)$ .

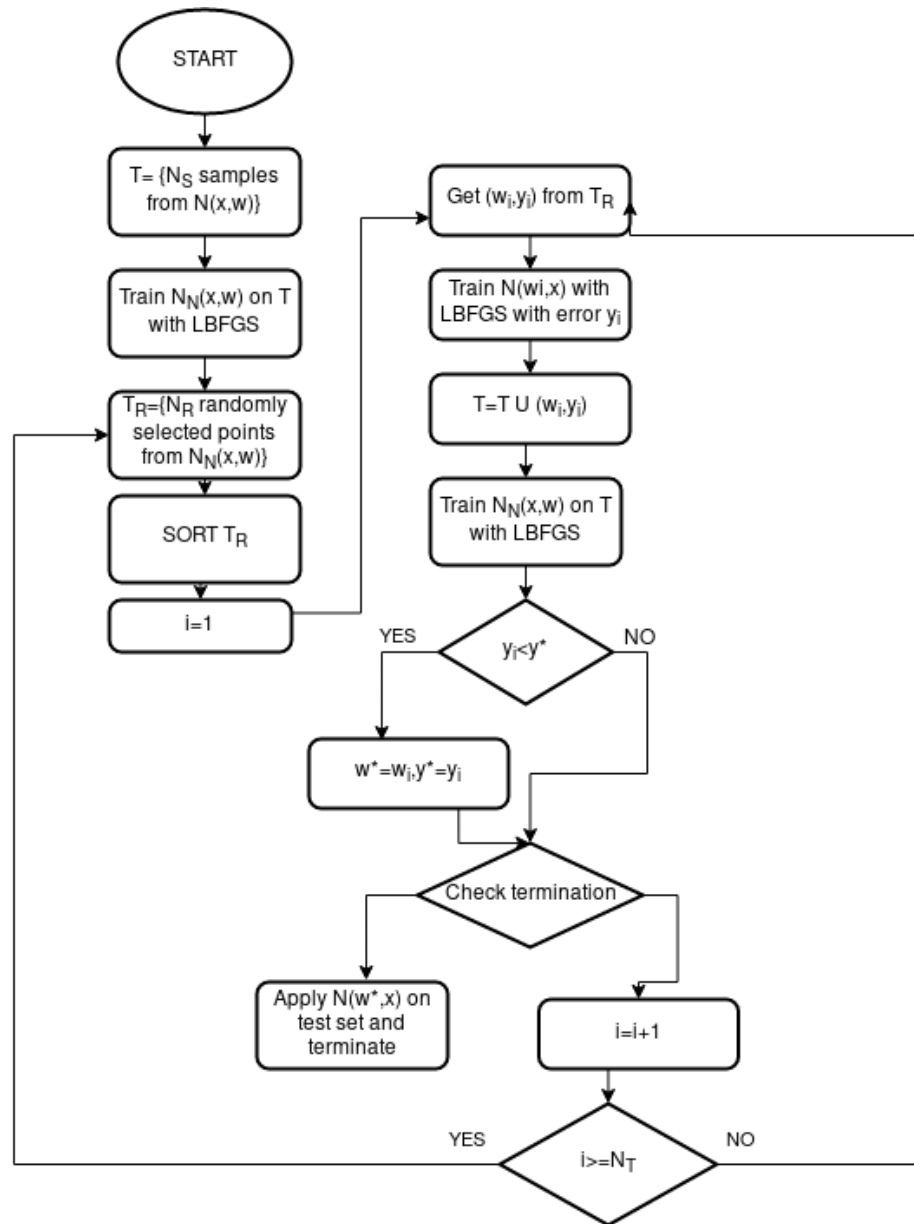

### 1. Initialization step.

- (a) **Set**  $H$  the number of weights of the neural network. In the current method the same number of weights was used for both  $N(x, w)$  and  $N_N(x, w)$  artificial neural networks.
- (b) **Set**  $N_S$  as the samples that will be initially drawn from  $N(x, w)$ . At this stage, the training error for the artificial neural network will be used as an objective function to minimize
- (c) **Set**  $N_T$  as the the number of points that will be utilized as local minimization method starters in every iteration.
- (d) **Set**  $N_R$  the number of samples that will be drawn from the  $N_N(x, w)$  network in each iteration.
- (e) **Set**  $N_G$  as the maximum number of iterations allowed.
- (f) **Set**  $\text{Iter}=0$ , the current iteration number.
- (g) **Set**  $(w^*, y^*)$  as the global minimum discovered by the method. Initially  $y^* = \infty$ ,  $w^* = (0, 0, \dots, 0)$

### 2. Creation Step.

- (a) **Set**  $T = \emptyset$ , the used training set for the  $N_N(x, w)$  neural network.
- (b) **For**  $i = 1, \dots, N_S$  do
  - i. **Draw** a new sample  $w_i$  from  $N(x, w)$ .

|      |                                                                                                                                                                                                                                                                                                 |                          |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| ii.  | <b>Calculate</b> $y_i = f(w_i)$ using Equation 1                                                                                                                                                                                                                                                | 142                      |
| iii. | $T = T \cup (w_i, y_i)$                                                                                                                                                                                                                                                                         | 143                      |
| (c)  | <b>EndFor</b>                                                                                                                                                                                                                                                                                   | 144                      |
| (d)  | <b>Train</b> the $N_N(x, w)$ neural network on set $T$ using the L-BFGS method.                                                                                                                                                                                                                 | 145                      |
| 3.   | <b>Sampling Step</b>                                                                                                                                                                                                                                                                            | 146                      |
| (a)  | <b>Set</b> $T_R = \emptyset$                                                                                                                                                                                                                                                                    | 147                      |
| (b)  | <b>For</b> $i = 1, \dots, N_R$ <b>do</b>                                                                                                                                                                                                                                                        | 148                      |

| i.   | <b>Get</b> the next item $(w_i, y_i)$ from $T_R$ .                                                                                                                                                                                                                                              | 155                      |
| ii.  | <b>Train</b> the neural network $N(w_i, x)$ on the train set of the objective problem, using the L-BFGS method and get the corresponding training error $y_i$ .                                                                                                                                 | 156<br>157<br>158        |
| iii. | <b>Update</b> $T = T \cup (w_i, y_i)$                                                                                                                                                                                                                                                           | 159                      |
| iv.  | <b>Train</b> again the network $N_N(w, x)$ on the modified set $T$ . In this step the original train set used by $N_N(x, w)$ is updated to include the new discovered local minimum. This operation is used in order to construct a more accurate approximation of the real objective function. | 160<br>161<br>162<br>163 |
| v.   | <b>If</b> $y_i \leq y^*$ then $w^* = w_i, y^* = y_i$                                                                                                                                                                                                                                            | 164                      |
| vi.  | <b>If</b> the termination rule proposed in [97] then apply the produced network $N(w^*, x)$ on the test set of the objective problem, report the test error and <b>terminate</b> .                                                                                                              | 165<br>166<br>167        |
| (b)  | <b>EndFor</b>                                                                                                                                                                                                                                                                                   | 168                      |
| 5.   | <b>Set</b> iter=iter+1                                                                                                                                                                                                                                                                          | 169                      |
| 6.   | <b>Goto</b> to Sampling step.                                                                                                                                                                                                                                                                   | 170                      |
|      | A flowchart of the proposed method is graphically outlined in Figure 2.                                                                                                                                                                                                                         | 171                      |

**Figure 2.** The flowchart of the proposed method.

### 3. Experiments

The efficiency of the proposed artificial neural network training technique was evaluated using a series of data sets from the relevant literature. These datasets have been studied by various researchers in the relevant literature and cover a wide range of research areas from Physics to Economics. These datasets are freely available from the following websites:

1. The UCI repository, <https://archive.ics.uci.edu/> (accessed on 17 June 2023)[98]
2. The Keel repository, <https://sci2s.ugr.es/keel/datasets.php> (accessed on 17 June 2023)[99].
3. The Statlib URL <ftp://lib.stat.cmu.edu/datasets/index.html> (accessed on 17 June 2023). This repository is used mainly for the regression datasets.

#### 3.1. Experimental datasets

The following classification datasets from the relevant literature were used in the experiments:

1. **Appendictis**, a dataset used for medical purposes and it was found in [100,101]. 186
  2. **Australian** dataset [102], an economic dataset, related to bank transactions. 187
  3. **Balance** dataset [103], which is related to psychological experiments. 188
  4. **Cleveland** dataset, a medical dataset found in the following research papers[104,105]. 189
  5. **Bands** dataset, related to printing problems [106]. 190
  6. **Dermatology** dataset [107], a dataset related to dermatology problems. 191
  7. **Hayes roth** dataset [109]. 192
  8. **Heart** dataset [108], a medical dataset used to detect heart diseases. 193
  9. **HouseVotes** dataset [110], related to the Congressional voting records of USA. 194
  10. **Ionosphere** dataset, related to measurements from the ionosphere an thoroughly 195  
studied in a series of research papers [111,112]. 196
  11. **Liverdisorder** dataset [113,114], a medical dataset. 197
  12. **Lymography** dataset [115]. 198
  13. **Mammographic** dataset [116], a medical dataset related to breast cancer diagnosis. 199
  14. **Page Blocks** dataset [117]. 200
  15. **Parkinsons** dataset [118,119], a medical dataset applied to the Parkinson's decease. 201
  16. **Pima** dataset [120], a medical dataset. 202
  17. **Popfailures** dataset [121], a dataset related to meteorological data. 203
  18. **Regions2** dataset, a medical dataset for liver biopsy images [122]. 204
  19. **Saheart** dataset [123], a medical dataset related to heart diseases. 205
  20. **Segment** dataset [124], a dataset related to image segmentation. 206
  21. **Wdbc** dataset [125], a dataset about breast tumors. 207
  22. **Wine** dataset, a dataset related to chemical analysis of wines [126,127]. 208
  23. **Eeg** datasets [128,129], it is an EEG dataset and the following cases were used in the 209  
experiments: 210
    - (a) **Z\_F\_S**, 211
    - (b) **ZO\_NF\_S** 212
    - (c) **ZONF\_S**. 213
  24. **Zoo** dataset [130], suggested for to detect to proper class of animals. 214
- A table showing the number of classes for every classification dataset is shown in Table 1. 215

**Table 1.** Description for every classification dataset.

| DATASET       | CLASSES |
|---------------|---------|
| Appendictis   | 2       |
| Australian    | 2       |
| Balance       | 3       |
| Cleveland     | 5       |
| Bands         | 2       |
| Dermatology   | 6       |
| Hayes Roth    | 3       |
| Heart         | 2       |
| Housevotes    | 2       |
| Ionosphere    | 2       |
| Liverdisorder | 2       |
| Lymography    | 4       |
| Mammographic  | 2       |
| Page Blocks   | 5       |
| Parkinsons    | 2       |
| Pima          | 2       |
| Popfailures   | 2       |
| Regions2      | 5       |
| Saheart       | 2       |
| Segment       | 7       |
| Wdbc          | 2       |
| Wine          | 3       |
| Z_F_S         | 3       |
| ZO_NF_S       | 3       |
| ZONF_S        | 2       |
| Zoo           | 7       |

The following regression datasets were used:

1. **Abalone** dataset [132], proposed to predict the age of abalones. 216
2. **Airfoil** dataset, a dataset provided by NASA [133], created from a series of aerodynamic and acoustic tests. 217
3. **Baseball** dataset, a dataset used to baseball games. 218
4. **BK** dataset [134], used to predict the points scored in a basketball game. 219
5. **BL** dataset, used in machine problems. 220
6. **Concrete** dataset [135], a dataset proposed to calculate the concrete compressive strength 221
7. **Dee** dataset, used to detect the electricity energy prices. 222
8. **Diabetes** dataset, a medical dataset. 223
9. **Housing** dataset [136]. 224
10. **FA** dataset, used to fit body fat to other measurements. 225
11. **MB** dataset [137]. 226
12. **Mortgage** dataset. The goal is to predict the 30-Year Conventional Mortgage Rate. 227
13. **PY** dataset, (Pyrimidines problem)[138]. 228
14. **Quake** dataset, used to approximate the strength of an earthquake given its the depth of its focal point, its latitude and its longitude. 229
15. **Treasure** dataset, which contains Economic data information of USA, where the goal is to predict 1-Month CD Rate. 230
16. **Wankara** dataset, a weather dataset. 231

### 3.2. Experimental setup 232

The proposed method was tested on the regression and classification problems mentioned previously, and it was compared against the results of several other well - known 233

approaches of the relevant literature. For greater reliability of the experimental results, the 10 - fold validation technique was employed for every classification or regression dataset. Every experiment was executed 30 times, with different initialization for the random generator each time. Also, the `rand48()` random generator of the C - programming language was utilized. The used code was implemented in ANSI C++ using the freely available OPTIMUS optimization library available from <https://github.com/itsoulos/OPTIMUS/>. For the case of classification datasets, the average classification error is measured for every method and for regression datasets the average mean squared error is measured in the test set. The number of hidden nodes for the neural networks was set to  $H = 10$  for every method. All the experiments were performed using an AMD Ryzen 5950X with 128GB of RAM. The running operating system was Debian Linux. The methods used in the experimental results are the following:

1. A genetic algorithm with 200 chromosomes used to train a neural network with  $H$  hidden nodes. This method was denoted as GENETIC in the tables holding the experimental results.
2. A Radial Basis Function (RBF) network [81] having  $H$  hidden nodes.
3. The Adam optimization method[139]. Here the method is used to minimize the train error of a neural network with  $H$  hidden nodes.
4. The resilient back propagation (RPROP) optimization method[34–36] was employed also to train a neural network with  $H$  hidden nodes.
5. The NEAT method (NeuroEvolution of Augmenting Topologies ) [140].

The values used for every parameter are listed in Table 2 and they are similar to the values used in the original publication of the NeuralMinimizer method.

**Table 2.** Experimental settings.

| PARAMETER | MEANING                              | VALUE           |
|-----------|--------------------------------------|-----------------|
| $H$       | Number of weights                    | 10              |
| $N_S$     | Start samples                        | 50              |
| $N_T$     | Starting points                      | 100             |
| $N_R$     | Samples drawn from the first network | $10 \times N_T$ |
| $N_G$     | Maximum number of iterations         | 200             |

### 3.3. Experimental results

The experimental results for the classification datasets are shown in Table 3 and for the regression datasets in Table 4. The column PROPOSED stands for the usage of the proposed method to train a neural network with  $H$  hidden nodes. In both tables, the last row (denoted as AVERAGE) represents the mean error for each method. Also, the figure 3 shows a scatter plot and the Wilcoxon signed-rank test for the classification datasets. In the same direction, the figure 4 shows the scatter plot for the regression datasets.

**Table 3.** Experimental results for the classification datasets. The numbers in cells denote average classification error of 30 independent runs.

| DATASET        | GENETIC       | RBF           | ADAM          | RPROP         | NEAT          | PROPOSED      |
|----------------|---------------|---------------|---------------|---------------|---------------|---------------|
| Appendicitis   | 18.10%        | 12.23%        | 16.50%        | 16.30%        | 17.20%        | 22.30%        |
| Australian     | 32.21%        | 34.89%        | 35.65%        | 36.12%        | 31.98%        | 21.59%        |
| Balance        | 8.97%         | 33.42%        | 7.87%         | 8.81%         | 23.14%        | 5.46%         |
| Bands          | 35.75%        | 37.22%        | 36.25%        | 36.32%        | 34.30%        | 33.06%        |

**Figure 3.** Scatter plot representation and the Wilcoxon signed-rank test results of the comparison for each of the five (5) classification methods (GENETIC, RBF, ADAM, RPROP, NEAT) with the PROPOSED method regarding the classification error in twenty-six (26) different public available classification datasets. Star links join significantly different values; three stars (\*\*\*) stand for  $p < 0.001$ .

**Figure 4.** Scatter plot representation and the Wilcoxon signed-rank test results of the comparison for each of the five (5) regression methods (GENETIC, RBF, ADAM, RPROP, NEAT) with the PROPOSED method regarding the regression error in sixteen (16) different publicly available classification datasets. Star links join significantly different values; three stars (\*\*\*) stand for  $p < 0.001$ . The notation "ns" denotes "not significant".

The experimental results and their graphical representation demonstrate the superiority of the proposed technique over the others in terms of the average error, as measured in the test set. For example, in the case of datasets used for classification, the proposed method outperforms the remaining techniques in 19 out of 26 datasets (73% percent). Also, in several cases, the percentage reduction in error exceeds 50%. For the classification problems, the immediate most effective training method after the proposed one is the genetic algorithm and, on average, the proposed technique achieves lower classification error than the genetic algorithm error by 24%. Moreover, in regression problems, the next most effective method after the proposed one is the RBF neural network with small differences from the ADAM optimizer. However, in the case of regression problems, the improvement in average error by using the proposed technique exceeds 49%. Of course, the proposed technique is quite time-consuming since it requires continuous training of an artificial neural network.

#### 4. Conclusions

In this work, the application of a recent global minimization method for the training of artificial neural networks was proposed. The application of this method was used in artificial neural networks both for classification problems and for regression problems. This new global minimization method constructs an approximation of the objective function using neural networks. This construction is done with a limited number of samples from the objective function. However, each time a local minimization takes place, this approximation is readjusted. Subsequently, the sampling for the minimization is done from the approximate function and not from the objective one, even taking samples from the approximation with the smallest function value, in order to speed up the finding of

the global minimum. In this particular case, the artificial neural network of the global minimization method is used to train the artificial neural network. However, due to the large time and storage requirements of artificial neural networks, the RBF network of the original NeuralMinimizer method was replaced with an artificial neural network that was trained using the local minimization method L-BFGS. The new artificial neural network training technique is tested on a wide collection of classification and regression problems from the relevant literature and is shown to significantly improve the learning error over other established artificial neural network training techniques. This improvement is 25% on average for the case of classification problems and rises significantly to 50% for regression problems.

Nevertheless, the proposed procedure can be extremely slow, especially as the size of the artificial neural network increases. The size of the artificial neural network directly depends on the dimension of the input dataset. Future improvements to the methodology may include the use of parallel programming techniques, such as parallel implementations of the L-BFGS optimization method, in order to accelerate the training of artificial neural networks by taking advantage of modern computing structures. Also, in the present phase, as a minimization method in step 4 of the proposed training method, a local minimization method is used. Future extensions could explore the possibility of also using global minimization techniques in this step, although care should be taken to make use of parallel computing techniques to avoid long execution times.

**Author Contributions:** I.G.T. and A.T. conceived of the idea and the methodology and I.G.T. has implemented the corresponding software. I.G.T. conducted the experiments, employing objective functions as test cases, and provided the comparative experiments. A.T. has performed the necessary statistical tests. All authors have read and agreed to the published version of the manuscript.
